CLAUDE × BRIGHT DATA · BUILD NIGHT

SkyWatch

A live world flight radar with an AI flight analyst.

Babu Sovereign Perumalla · October 2026

BUILT AT A CLAUDE EVENT

Claude Code Build Night

Research with Web Data
San Francisco · October 20, 2026

Designed, built and demoed in one evening with Claude Code, Claude and Bright Data.

THE PROBLEM

A dot tells you *where* a plane is. Not *what* it is.

Flight maps show positions and callsigns. The story behind each flight (airline, route, aircraft, status) lives scattered across the web.

WHAT IT DOES

Three ways to explore the sky

Live world map

10,000+ aircraft, colored by altitude, gliding continuously between updates.

Brief me

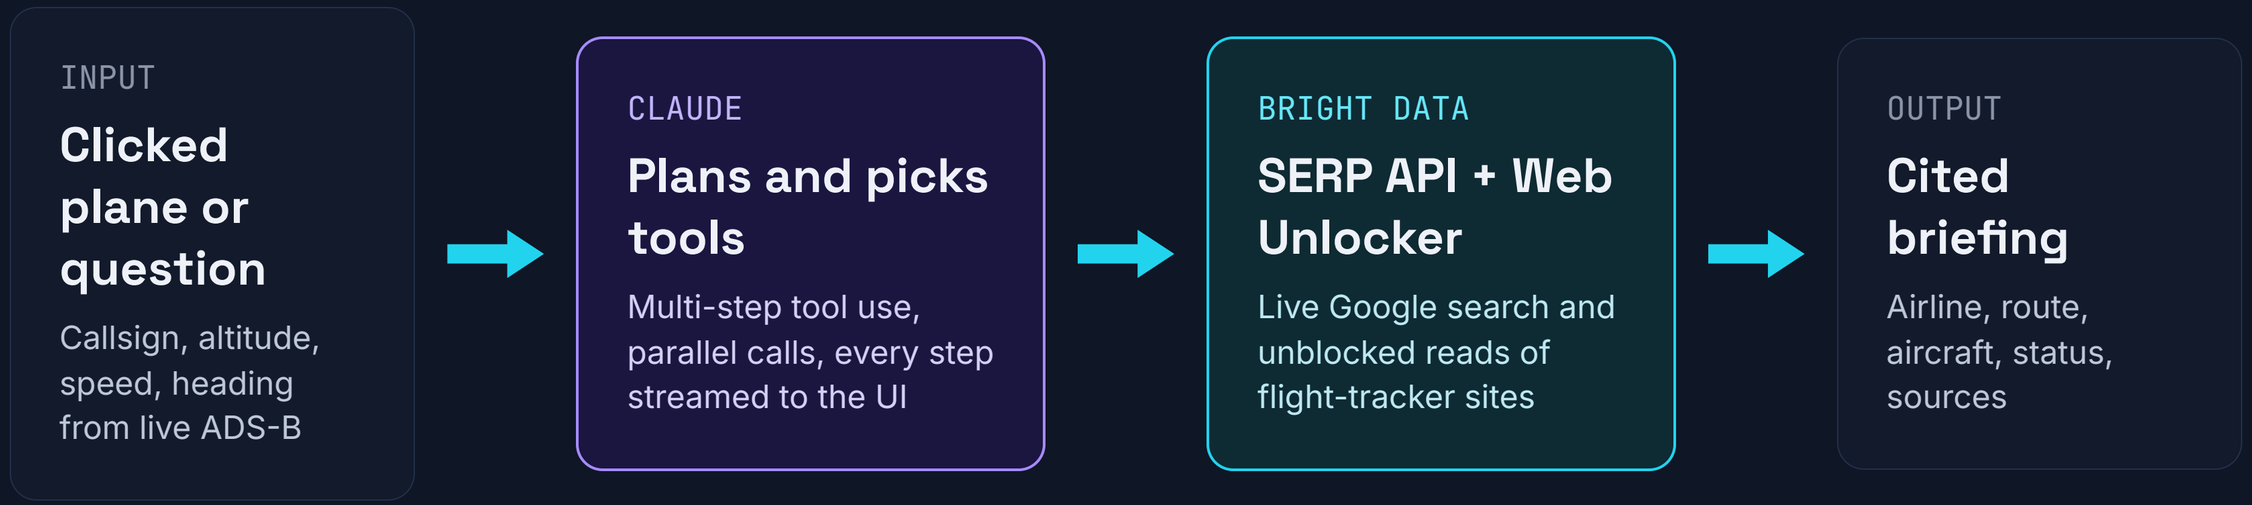

Click any plane. Claude researches it live and returns airline, route, aircraft and status, with sources.

Ask the skies

Questions about the traffic on screen, answered from the live snapshot plus the web.

HOW IT WORKS

An agent loop with live web tools

Two tools: web_search (SERP API) and fetch_page (Web Unlocker). Claude decides when and how to use them.

WHO DOES WHAT

Claude is the brain. Bright Data is the eyes.

Claude

- Decides what to search and which pages to read
- Reasons over the live traffic snapshot
- Writes a briefing and says plainly what it can’t confirm
- Also built the app with me, tonight

Bright Data

- **SERP API:** live Google search for Claude
- **Web Unlocker:** reads tracker and airline pages past blocks and CAPTCHAs
- Also fetches the worldwide ADS-B feed

BUILT FOR SPEED

The whole planet, without the wait

10k+

aircraft drawn on one canvas: dots when zoomed out, icons when zoomed in

0 s

startup wait: the server boots from a preloaded world snapshot

30 s

live refresh in the background; panning and zooming served from memory

60 fps

smooth motion: each plane is dead-reckoned from its speed and heading

LIVE DEMO

Let’s look at the sky

1. Zoom out: every airborne plane on Earth
2. Zoom into SFO: watch them glide
3. Click a plane → Brief me
4. Ask: “What’s the fastest plane and where is it going?”

WHAT'S NEXT

From radar to flight companion

Route lines

Auto-enrich every plane and draw origin → destination on the map

Track a flight

Follow one plane and get alerts on delays or diversions

Airport pulse

Live delay and weather summaries for any airport in view

Thank you
